

Rowe AI Chatbot Installation Guide

A simple, business-owner-friendly guide to adding your Rowe AI Chatbot to your website.

Designed for quick setup, clear instructions, and confident launch.

Prepared for Rowe AI clients

Introduction

Welcome to Rowe AI. This guide walks you through adding your chatbot to your website so visitors can ask questions, get helpful answers, and connect with your business more easily. You do not need to be a developer to follow the steps, but you may want to share the embed code with your website manager if someone else maintains your site.

1. Before You Start

Before installing your chatbot, make sure you can access your Rowe AI client dashboard and that your chatbot settings are saved. Your welcome message, tone, response length, custom instructions, and FAQs help shape how the chatbot responds to your customers.

- Open your Rowe AI client dashboard.
- Review your chatbot settings and save any changes.
- Have access to your website editor, website builder, or web developer.
- Decide where the chatbot should appear. Most businesses place it on every public page.

2. Find Your Chatbot Embed Code

In your client dashboard, look for the installation area labeled Frontend URL and PDF. You will see your chatbot script URL, your embed code, and a button to copy the URL or code.

[Screenshot: Insert screenshot of the chatbot URL and Copy URL button here]

Example Chatbot Script URL

```
https://ai-platform-frontend-uaaa.onrender.com/widget.js
```

Example Embed Script

```
<script  
  src="https://ai-platform-frontend-uaaa.onrender.com/widget.js"  
  data-business="YOUR_BUSINESS_ID"  
  defer  
></script>
```

Replace YOUR_BUSINESS_ID with the business ID shown in your dashboard. If the dashboard already fills in your business ID, copy the code exactly as shown.

3. Add the Chatbot to Your Website

The chatbot is installed by adding one small script to your website. The best location is usually right before the closing body tag on your site, so it loads on every page.

Step 1: Copy the embed code

In the dashboard, click Copy URL or copy the full embed script from the installation card.

Step 2: Open your website editor

Log in to your website builder or admin area. Look for a section named Custom Code, Footer Code, Header/Footer Scripts, Theme Code, or Tracking Scripts.

Step 3: Paste the embed script

Paste the embed script near the end of the page body or in the global footer code area.

Step 4: Save and publish

Save your changes and publish your website. Open your website in a new browser tab to confirm that the chatbot appears.

```
<script  
  src="https://ai-platform-frontend-uaaa.onrender.com/widget.js"  
  data-business="YOUR_BUSINESS_ID"  
  defer  
</script>
```

[Screenshot: Insert screenshot of the chatbot bubble on the live website here]

4. Test the Chatbot

After publishing, visit your website like a customer would. Click the chatbot bubble and ask a simple question about your business, such as your hours, services, pricing, or contact information.

- Confirm the chatbot bubble opens and closes correctly.
- Ask a question that should be answered from your knowledge base.
- Review the response for accuracy and tone.
- If needed, return to the dashboard, update your settings or knowledge base, and test again.

5. Website Platform Tips

Most website builders support custom scripts, but the name of the setting may vary.

- WordPress: Use a header/footer script plugin or add the code to your theme footer.
- Shopify: Add the script to theme.liquid before the closing body tag.
- Squarespace: Use Settings > Advanced > Code Injection.
- Wix: Use Custom Code in the site dashboard and apply it to all pages.
- Custom websites: Ask your developer to place the script before the closing body tag.

6. Troubleshooting

Chatbot does not appear

- Confirm the script was saved and published on your website.
- Make sure the script URL starts with https://.
- Check that your business ID is included in the data-business field.
- Clear your browser cache or open the site in a private window.

Chatbot appears but does not answer correctly

- Review your knowledge base for missing or outdated information.
- Update your tone, instructions, FAQs, and response length in the dashboard.
- Save settings and test again.

Website builder removes the script

- Use the official Custom Code or Code Injection area instead of a normal text block.
- If you use a web designer, send them this guide and the embed script.

7. FAQ

Do I need a developer to install the chatbot?

Not always. Many website builders let you paste custom code. If you are unsure, send this guide to your website manager.

Where should I place the embed script?

Place it in your global footer or just before the closing body tag so it appears on every page.

Can I change what the chatbot says?

Yes. Update your welcome message, tone, custom instructions, FAQs, and knowledge base in your Rowe AI dashboard.

Will the chatbot slow down my website?

The script is lightweight and loads as a small widget. It is designed to stay out of the way of your main website content.

Can I remove the chatbot later?

Yes. Remove the embed script from your website and publish the change.

8. Support Contact

If you need help installing or testing your chatbot, contact Rowe AI support. Include your business name, website URL, and a short description of what you are seeing.

Support Email	support@roweai.com
What to send	Business name, website URL, screenshots, and any error messages.

You are ready to launch your Rowe AI Chatbot.

Once installed, keep your knowledge base and FAQs updated so customers receive helpful, accurate answers.
